MatrixView Secures Tele-Enabled Echocardiography Project in North America

Sydney - 4 April 2006: MatrixView Limited [ASX:MVU] announced today a contract with Canadian-based Toronto Health Care Center (THCC) to deliver a tele-enabled, echocardiography management solution to three remote health clinics in Toronto, Canada. This landmark project will underpin MatrixView's expansion into the lucrative North American and Canadian telemedicine markets.

MATRIXiTi EchoPACStream™ will provide THCC with a number of technological advantages including enhanced data storage management, security and optimised transmission speeds.

A core feature of MATRIXiTi EchoPACStream™ is Adaptive Binary Optimisation (ABO™) technology, a specialised algorithm that efficiently transmits high quality images even in low-bandwidth environments. Other system features include: an integrated Document Management System to file referral orders, voice transcriptions, transcribed reports and clinical histories and secure portal functionality to enable referral physicians to view key images used for diagnosis, along with the patient reports.

According to MatrixView Chairman and Chief Executive Officer Mr Ravi Govindan, MATRIXiTi EchoPACStream™ is one of the only products offering the high speed, secure transmission speeds which emerging tele-health markets and large health care providers in North America, Canada and Europe are demanding.

"This is a very positive development for us," Mr Ravi Govindan said.

"With the number of worldwide cardiology procedures increasing at 20% per annum many hospitals are starting to exploit enterprise cardiology Picture Archive and Communication System (PACS) to deliver high quality health care services to patients in remote locations.

"MatrixView is pioneering the next generation of telecardiology and teleradiology solutions and is poised to capture a sizeable share of the global telemedicine market, which is valued at USD\$2 billion per annum," Mr Ravi Govindan said.

According to Toronto Health Care Center's President, Dr Karim Merali said MATRIXiTi PACStream™ will enable medical staff to cut tele-health diagnosis periods by one-third.

"This technology provides end-to-end telecardiology, improves productivity and takes us closer toward a filmless and paperless realm." said Dr Merali.

"ABO™'s algorithm has ushered in convergence on Wide Area Networks (WANs) in an industry where even the stalwarts are grappling with LAN (Local Area Network)-based convergence," said Mr Azim Fancy, Chairman of Modus Business Solutions, MatrixView's exclusive Canadian distributor.

"MATRIXITI not only optimises the bandwidth, but also increases staff productivity, and improves the patient care experience.

"We are very excited to bring this solution to healthcare providers in Canada," said Mr Fancy.
